Introduction

If you're not familiar with Florida's [SARnet](#) statewide repeater network, you can think of it as a “mega horn” for ham radio nerds. Imagine you're in the caboose of a loose-knit caravan stretching 200 miles across the Panhandle heading to Key West. Amateur radio operators in your group can stay in touch using *any* SARnet repeater that broadcasts to *all* SARnet repeaters across the state.

There's just one problem: SARnet's [website & charts](#) lack ease-of-use. Sure, you can download a [Chirp](#) file from [RepeaterBook](#) and upload it to your mobile unit, *but then what?*

[Playground Amateur Radio Club](#) will show how to use Chirp, scissors, tape, and 3x5 index cards to improve mobile amateur radio on Florida's interstates & turnpike.

WARNING: It is a violation of 47 C.F.R. § 97 (2026) to use SARnet without an active U.S. FCC license to operate amateur radio equipment.

PARC volunteered to maintain this product because *no one has a responsibility to create it*:

- Florida's DOT has no responsibility to document amateur radio experiments,
- SARnet's lead team has no responsibility to create post-implementation products,
- SARnet's webmaster has no responsibility to create ease-of-use products, and
- SARnet control operators have no responsibility outside their repeater(s).

You can help us make this product better

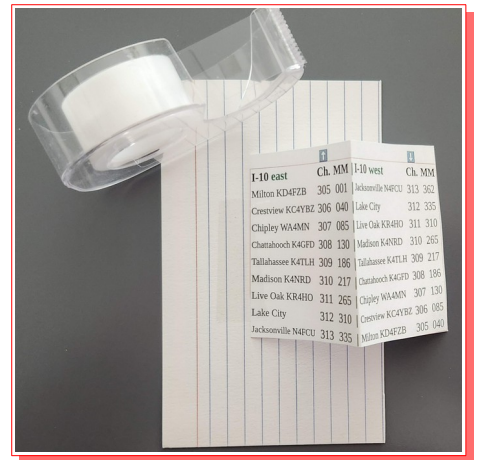

This first edition used SARnet & RepeaterBook coverage maps to determine the range of mile markers for each repeater. You can help us improve this product! Please write to [this email](#) with better mile marker ranges, long-term outages, or anything else you can think of. You **must** include “PARC SARnet” in the subject line. Thanks!

Instructions

Print out the *next* page and grab your scissors

Cut out each interstate, fold it in half at the green dotted line, and slide it over a 3x5 index card. You can tape or staple or laminate it to the card as you wish. (We won’t judge you!)

Your 3x5 index cards will make it simple as you travel the interstates or turnpike. Select the channel covering the mile marker where you entered the highway, and press your channel  or  button at each suggested mile marker. *(See above if you want to suggest better mile markers.)*

Add the **parc_sarnet_v100.csv** Chirp file to your device

SARnet channels reside in the **300-349 range**. We **strongly** recommend you download & save a copy of your device’s memory channels before you make any modifications. Please make sure your device is [compatible](#) before using Chirp.

Reminder: Don’t announce QSY when you switch SARnet repeaters. That’s the beauty of it!

Technical notes

SARnet channels begin at 300 to avoid low-number channels that people tend to use. We started at “3” hundred because your 3 button probably says “D-E-F” (“F”lorida, get it?)

Each channel in the Chirp file specifies “,S,” to *skip scanning* by default. You can change it as you wish.

The Chirp file contains duplicate entries by design where routes intersect. For example, let’s say you’re driving I-10 east toward I-95. You’ll discover the last I-10 channel duplicates an I-95 channel. There’s also a special case for I-95 at the Rt. 1 junction to/from Key West so you can keep clicking the  or  button.

The Chirp file leaves some channels blank for future SARnet repeaters. If a new repeater comes online — and yes, that’s an “if” — it will only impact channel numbers assigned to that route.

Let’s address one small elephant in the room: sarnetfl.com doesn’t use a consistent acronym, so we settled on the first sentence of their home page where it begins “The **Statewide Amateur Radio Network (SARnet)** is...”

Copy the *look & feel* of this PDF for other products!

The previous page with all its tables provides a *human-to-machine interface* for Chirp files. [PARC](#) encourages [Ham](#) & [GMRS](#) operators to copy the look & feel (*aka trade dress*) of this PDF for other products. Get to it!

Change log & acknowledgments

Version 1.00. Initial release. PARC president D.J. KI4ZER accepted a proposal from Rob K4HST to host on the club’s website a product to simplify SARnet use on the interstates & turnpike. PARC membership at the January 2026 club meeting showed enthusiasm for it. Construction began using SARnet’s charts. RepeaterBook verified current Chirp settings. We used Google Maps to pick the mile markers. We cross-checked [this RadioReference wiki page](#) to detect any errors in our construction.

Please refer to the “You can help us make this product better” section on page 2 if you want to help us make this product better. Thanks!
